

# BEGINNER CODING WORKSHOP

berry

nice

GIRLS DIVERSIFYING  
TECHNOLOGY+

WELCOME!

GIRLS  
DIVERSIFYING  
*technology+*

# MATERIALS NEEDED FOR CLASS

# GOALS

Basic  
understanding  
of programming  
fundamentals  
and how we  
apply them in  
code!

Understanding  
what code is  
and why it is  
useful to us at  
all!

**JAVA IS THE  
PROGRAMMING  
LANGUAGE WE WILL USE  
FOR ACTIVITIES AND  
DEMOS**

# WHAT IS A COMPUTER?

# INPUT AND OUTPUT DEVICE

A computer is an electronic device that manipulates information, or data. It has the ability to store, retrieve, and process data.

# Code and Computers

WHAT DO  
YOU GUYS  
KNOW ABOUT  
CODING?

# BIG IDEAS WE WILL FOCUS ON

CLASSES

VARIABLES

METHODS

OPERATORS

# VARIABLES

Variables are essentially containers within classes, they store values to be referenced and manipulated in a computer program. They also provide a way of labeling data with a descriptive name, so our programs can be understood more clearly by the reader and ourselves.

# Types of Datatypes

## FOR NUMBERS

int -> eg 1

double -> eg 1.72276

float -> eg 1.0

## FOR CHARACTERS

char -> eg name

String -> eg my name is

## BOOLEAN

false

true

true

FALSE

# OPERATORS

An operator is a character that  
represents an action

# CONDITIONALS

A conditional statement tells a program to execute different actions depending on whether a condition is true or false.

# LOOPS

A loop is a sequence of instructions that are continually repeated until a certain condition is reached. Imagine you are in the grocery store looking for bananas, you keep circling through the produce isle till you find the bananas

# METHODS

A method is a procedure. In cooking you've got a recipe. And that recipe has different instructions eg from one to five. The instructions tell you what to do at that particular point as does a method.

**NOW FOLLOW  
ALONG AND  
WATCH THE  
CODE IN  
ACTION**

# TIME FOR YOU GUYS TO TRY SOME CODING

[https://www.tutorialspoint.com/compile\\_java\\_online.php](https://www.tutorialspoint.com/compile_java_online.php)

# TASK 1

1. Print "Hello World!" using a print statement in your main method
2. Add a comment to show what big idea you are using for step 3
3. Create a 2 variables in your class
4. Make variables equal to two numbers of your choice
5. Use your variables to complete an operation and store value in variables
6. Print result of operation

# Task Answer

```
1 public class HelloWorld{  
2  
3     //Using variables  
4     public static int var1 =1;  
5     public static int var2= 3;  
6  
7     public static void main(String []args){  
8         System.out.println("Hello World!");  
9         int result;  
10        result= var1+var2;  
11        System.out.println(result);  
12    }  
13 }
```

# TASK 2

1. Identify which of the five big ideas we need to repeat a set of code
2. Create a for loop, which allows you to set a conditional
3. Add the first two variables together
4. Create two new variables under the for loop
5. Create a variable to store the value of the sum of the two new variable
6. Print the new result

# Task Answer

```
public class HelloWorld{  
  
    //Using variables  
    public static int var1 =1;  
    public static int var2= 3;  
    public static int result;  
  
    public static void main(String []args){  
        result= var1+var2;  
        System.out.println("The result is "+result);  
  
        for(int i=0; i<5; i++) {  
            int newNum = 5;  
            int newResult = i+newNum;  
            System.out.println("The new result is "+newResult);  
        }  
    }  
}
```

# Workshop Recap

**Variables & Datatypes**

**Operators**

**Conditionals**

**Loops**

**Methods**
